Abstract
The Resonance Scalar Vacuum (RSV) framework is an inversion-centered mathematical structure built from a vacuum baseline located at V = -1. The framework introduces a signed inversion coordinate X and a logarithmic resonance scale L, providing a compact description of resonance behavior, symmetry boundaries, branch occupancy, and observable structure.

Core Foundation
$V = -1$
$X(t) = (1 + w(t)) / \epsilon$
$L(t) = -\log_{10}|X(t)|$

Interpretation
X(t) is the primary object of RSV. X is a dimensionless signed inversion-displacement coordinate.
A Branch: $X > 0$
B Branch: $X < 0$
Symmetry Boundary: $X = 0$ (equivalently $w = -1$).

Primitive Symmetry
$k = 1$
$\Delta L = -\log_{10}(k)$
$R^*A / R^*B = k$

Observable Layer
$R(X) = |dL/dX| = 1/(X \ln(10)) = 10^L/\ln(10)$

Resonance Wells
Resonance increases as |X| decreases. Extreme resonance occurs as $X \to 0$, $L \to \infty$, and $R(X) \to \infty$.

Dynamics
$dX/dt = \alpha X - \beta X^3$

RSV Origin
"What if it was as simple as -1?"

Repository Purpose
Public archive for RSV manuscripts, notes, figures, diagrams, visualizations, and supporting documentation.
